

What repeats across revolutions, and what does not

One point per revolution, the bar is the mean over the readable cells. Four results hold almost everywhere. Politics with administration is associated in fifteen cohorts and dissociated in none; politics with the military in thirteen and dissociated in none; politics with learning or culture is dissociated in fourteen and associated in none; administration with business is dissociated in all eight cohorts large enough to read. The people who ran the state and the people who wrote and taught were separate populations in the English Revolution and in the Iranian one alike. The pairs that divide the set sit in the middle of the column: politics with business and politics with nobility both run in both directions. A cohort is the elites who were adults in a country whose political order was at stake while the revolution ran. Sectors are coarsened to seven groups so a cohort cell has enough cases, and association is refitted inside each cohort, which makes cohorts of very different size comparable. Cells holding fewer than ten people are flagged sparse and dropped from every count, since the score there follows the continuity correction more than the data. These are descriptive cohorts, not treatment groups. Source: BHHT cross-verified database of notable people (Laouenan et al., Scientific Data 9:290, 2022).
