

Before, during and after: what politics was joined to, by birth cohort

The same countries split into 40-year birth cohorts, from 120 years before the window to 120 years after, with association refitted inside each block. The shaded band marks the birth years that put a person in the revolutionary cohort. The three results that repeat across cohorts repeat across the centuries inside them: politics with administration is positive in 86 of 87 readable blocks, politics with the military in 72 of 83, and politics with learning is negative in 82 of 85, before the revolution as much as after. Politics with business is the exception again, positive in 31 of 80. Only six of the sixteen have readable blocks entirely on both sides of the shaded band, and their contrasts do not point one way: politics with the military falls by 1.12 across the American Revolution and rises by 0.55 across the German one. Blocks below the hundred-pair floor are absent, so the series are not balanced.

A cohort is the elites who were adults in a country whose political order was at stake while the revolution ran. Sectors are coarsened to seven groups so a cohort cell has enough cases, and association is refitted inside each cohort, which makes cohorts of very different size comparable. Cells holding fewer than ten people are flagged sparse and dropped from every count, since the score there follows the continuity correction more than the data. These are descriptive cohorts, not treatment groups.
