

The predicted pairs, cohort by cohort

Shaded bands are 95% bootstrap intervals. The moves are real and mostly in the predicted direction, but look at where they happen. Politics with the military and politics with administration both rise across the shaded cohorts, which fits. The rest do not: the military-engineer tie is made between 1425 and 1500, before the window opens, and so is the fall in the military-religion tie; administration with the military is flat through the window and then falls after 1700, against the prediction. Most of this reorganisation is finished before Roberts' window starts. Europe only, 25-year birth cohorts. A cohort born in year b has its main career in [b+25, b+65], so the cohorts exposed to a 1560-1660 window are those born between 1495 and 1635; they are held out of the before-and-after contrast, not assigned to a side.
