

Two more tests, and neither helps the thesis

Real window against placebo windows

No gradient by military pressure

Left: the same six predictions evaluated across windows moved 100 years each way. A window a century earlier than Roberts' fits better than his own, 6 of 6 correct against 5 of 6 and a larger mean move, though it rests on only two pre-window cohorts. A window a century later fits worst. The windows overlap, which is all a single 500-year series can offer, but the ordering says the contrast is medieval against early modern and not sensitive to where in that span the cut falls. Right: high military pressure is France, Germany, Spain, Austria and Russia; low is the United Kingdom, the Netherlands, Switzerland and Sweden. If army-building drove the reorganisation the high bloc should have moved further on the predicted pairs. It did not on any of the seven, the two largest gaps run the wrong way, and the permutation test over which countries sit in which bloc clears 0.28 everywhere. Europe only, 25-year birth cohorts. A cohort born in year b has its main career in [b+25, b+65], so the cohorts exposed to a 1560-1660 window are those born between 1495 and 1635; they are held out of the before-and-after contrast, not assigned to a side.
