

The six crossings, country by country

Each country is fitted on its own, so its scores are net of its own domain sizes and comparable with another country's. Countries are grouped by Ward clustering on the six scores and ordered by size inside each group; hatching marks a cell not distinguishable from the reference model (BH $q \geq 0.05$). Political with security is positive in 34 of the 36 countries and distinguishable from the reference model in 32 of them; Canada and New Zealand are the two negatives.

Country is the cross-verified citizenship of the source, projected onto modern states, so the label is anachronistic for anyone born before the state existed. Coverage is encyclopaedic coverage: how many elites a country contributes says as much about which Wikipedia editions write about it as about the country. Source: BHHT cross-verified database of notable people (Laouenan et al., Scientific Data 9:290, 2022).
