

Brewer's predictions do not separate Britain from the continent

Left: Britain moves in the predicted direction in level on four of the six, but the donor pool moves further on the state-building pairs, so the difference in differences favours the thesis on only 2. The two that go sharply the wrong way, public credit and war contracting, are the ones that distinguish this thesis from the military revolution. Right: treating each unit in turn, Britain ranks last of the five. With four donors the smallest rank test this design can return is 0.20 and Britain sits at 1.00. A second null, permuting over the fifteen pairs the thesis says nothing about, gives $p = 0.82$. Sectors are coarsened to seven groups so a country and cohort cell has enough cases; politics and administration stay apart because their fusion is the claim, and business stays apart because public credit is what separates this thesis from the military revolution. A cohort born in b works in $[b+25, b+65]$, so the cohorts whose whole career falls inside 1688-1783 are those born 1663 to 1718.
