

Two readings that complicate the verdict

The head-to-head Brewer actually draws

What happens after the window closes

Left: on the sharpest contrast Brewer draws, the tie between office and birth, Britain falls by 0.26 and France by 0.22. A dead heat. The largest gap between them runs the other way: the tie between arms and money collapses in Britain and tightens in France. Right: after 1783 Britain does pull away from the donor pool on five of the six, which is the pattern the thesis predicts, a century after the window it predicts it in. Sectors are coarsened to seven groups so a country and cohort cell has enough cases; politics and administration stay apart because their fusion is the claim, and business stays apart because public credit is what separates this thesis from the military revolution. A cohort born in b works in $[b+25, b+65]$, so the cohorts whose whole career falls inside 1688-1783 are those born 1663 to 1718.
