

What the panel actually contains

Elites crossing two domains in each country and 25-year birth cohort. A cell enters the event study only above 120 crossings. The vertical bar marks the first exposed cohort for that country's shock, taken as 50 years before the shock year because a cohort's careers run roughly 25 to 90 years after birth. Read the gaps: Argentina and Brazil have no cohort at all before their shock, so they cannot enter. Only four countries are never exposed inside the window, and three of the four rupture cases share a single event in 1918. Source: BHHT cross-verified database of notable people (Laouenan et al., Scientific Data 9:290, 2022). Shocks hand-coded, see data/processed/shocks/shock_list.csv.
