

No shock shows a persistent effect that the randomization null does not already produce

ATT(e) from a Callaway-Sant'Anna style group-time estimator with not-yet-exposed and never-exposed countries as controls, cells weighted by the inverse of their bootstrap variance. Event time -1 is the reference; the black line marks exposure. The grey band is the middle 95% of 2,000 draws in which the shock years are reassigned at random across the sixteen panel countries. Five of the 72 estimates fall outside it, against 3.6 expected by chance, and none survives a Benjamini-Hochberg adjustment. Two of the five are at pre-exposure event times, which is a failure and not a finding. Source: BHHT cross-verified database of notable people (Laouenan et al., Scientific Data 9:290, 2022). Shocks hand-coded, see data/processed/shocks/shock_list.csv.
