

A linear trend cannot see a step. Scanning for one.

Each pair is fitted with a common slope plus one level shift at an unknown date; the largest Wald statistic over all admissible dates is the test statistic, and its null distribution is simulated 2,000 times under a no-shift model using each cohort's own bootstrap standard error. The pooled panels sum that statistic over every pair, so they ask whether one date fits the whole system. Read the 1100 result in the first panel with care: it rests on cohorts of a few thousand people. Source: BHHT cross-verified database of notable people (Laouenan et al., Scientific Data 9:290, 2022).
