

The space of power, and which fields keep their place in it

Fields placed so that association is closeness

How far each field moves between revolutions

Left: the seven fields placed by classical scaling of the pooled association matrix, so that fields held by the same people sit close. Each cohort's own matrix is scaled the same way and rotated onto the pooled map, and its seven positions are the small grey dots. Sparse cells are filled with the pooled value before scaling, which pulls a small cohort towards the middle, so a thin cohort contributes short spokes by construction and the lengths are a floor on the real movement. Right: the mean distance a field travels from its pooled position. Learning, politics and administration keep their place; business moves furthest, at more than twice the distance learning moves, with religion behind it. The two fields whose place in the structure of elite power is least settled across revolutions are the two that are not the state. A cohort is the elites who were adults in a country whose political order was at stake while the revolution ran. Sectors are coarsened to seven fields and association is refitted inside each cohort, so cohorts of very different size are comparable. A tie is $\log_2(\text{observed} / \text{expected under quasi-independence})$: positive means the two fields were held by the same people more often than the size of each field implies, negative means less often. Cells holding fewer than ten people are dropped. These are descriptive cohorts, not treatment groups.
