

A settled core, and ties to the nobility that roam

Each line is one pair of fields, placed by where it sits in that cohort's own ordering; six are drawn out and the other fifteen left grey. Position is used instead of rank because cohorts resolve between seven and twenty-one pairs, so fourth of nine and fourth of twenty-one are not the same place. A line breaks where the cohort's cell holds fewer than ten people. Two ties never leave their end: religion with learning stays in the top two fifths of all fourteen cohorts that can read it, and administration with business in the bottom quarter of all eight. The lines that cross the panel are ties involving the nobility and business, the two fields the map in figW03 shows moving most: the nobility with learning runs from the top seventh of the Cuban ordering to near the bottom of the Meiji one, politics with the nobility from a quarter of the way down the Glorious ordering to the very bottom of the Turkish one, and business with religion from the top of the Mexican ordering to the bottom of the German one.

A cohort is the elites who were adults in a country whose political order was at stake while the revolution ran. Sectors are coarsened to seven fields and association is refitted inside each cohort, so cohorts of very different size are comparable. A tie is $\log_2(\text{observed} / \text{expected under quasi-independence})$: positive means the two fields were held by the same people more often than the size of each field implies, negative means less often. Cells holding fewer than ten people are dropped. These are descriptive cohorts, not treatment groups.
