

Tilly's capital side holds. His coercion side does not.

Each point is a country, the bar is the path's mean. Politics with business runs exactly as Tilly says, from +0.14 among the capital-intensive states to -0.71 among the coercion-intensive ones, monotone across all three paths and surviving the adjustment for the five tests in this era. The three coercion-side predictions do not hold: politics with the military is highest among the capital-intensive states, and administration with business is highest among the coercion-intensive ones, both the reverse of the prediction. Sectors are coarsened to seven groups so a country and era cell has enough cases. Paths are coded from Tilly's own examples onto the modern states the source uses; the lossiest case is Italy, which merges Venice and Genoa with the papal and southern states. Inference permutes the path labels across countries. Source: BHHT cross-verified database of notable people (Laouenan et al., Scientific Data 9:290, 2022).
