

Where the paths separate, and when

The two axes, 1600-1799 cohorts

When each prediction holds

Left: on the capital axis the three paths separate cleanly, with every coercion-intensive state left of zero except Austria. On the coercion axis they do not separate at all. Right: the capital-side prediction holds only in 1600-1799, Tilly's formative period, and is gone afterwards. The coercion-side predictions come closest in 1800-1899, a century after the period the thesis is about, and never reach 0.05. Sectors are coarsened to seven groups so a country and era cell has enough cases. Paths are coded from Tilly's own examples onto the modern states the source uses; the lossiest case is Italy, which merges Venice and Genoa with the papal and southern states. Inference permutes the path labels across countries. Source: BHHT cross-verified database of notable people (Laouenan et al., Scientific Data 9:290, 2022).
